# **ROOF SARKING INSTALLATION GUIDANCE**CLASS 1 RESIDENTIAL TILED ROOFS

# **TILED ROOF INSTALLATION GUIDANCE**

#### **TILED ROOF INSTALLATION GUIDANCE**

Roof sarking should be installed in accordance with AS/NZS 4200.2:2017 Pliable Building Membranes and Underlays - Installation.

 $\label{lem:commended} Recommended instructions for a compliant installation:$ 

- The printed, non-reflective or antiglare surface of this product must be installed facing outwards.
- Roof sarking should be installed under battens with a maximum sag of 40mm to manage thermal performance and be angled at >2° to facilitate drainage.
- When the product is installed under battens it must be rolled out horizontally.
- When rolling horizontally the top layer should overlap the bottom layer by 150mm.
- If needed, to hold sarking in place prior to application of battens, use bullet head nails or galvanised staples - where possible all overlaps and end joins should be fixed onto a rafter.
- Roof sarking should continue over the ridge line with an overlap of at least 150 mm on each side.
- At the fascia, the product should only overlap the fascia edge by 25mm and not restrict drainage to the gutter.
- Optional: To create an air or vapour barrier, all overlaps should be taped.
- \* All damaged, punctured or torn material should be repaired or replaced to maintain the original properties of this product.
- \* For more detailed installation guidance, refer to AS/NZS 4200.2:2017

**Weather Exposure**: Roof sarking is a secondary material and is not designed to withstand prolonged direct exposure to the elements - accordingly, the exterior cladding should be installed without delay. Product exposed to harsh weather conditions, for more than 2 weeks for roof applications, should be inspected for damage prior to installation of the exterior cladding and damaged product should be repaired or replaced to comply with the product warranty.
